# Introduction to Computer Security

NYU

Session 0

## Introduction and Threat Modeling

Prof. Nadim Kobeissi

# Introduction

Welcome!

0a

# Welcome to your new course!

## Open discussions.

- We can adopt a seminar style and focus more on practical work.
- Feel free to ask questions any time.
- You can do the readings before or after class.

## Important notes.

- Don't miss sessions. This is an intensive course: demanding assignments, packed sessions, strict grading.
- Pioneers from all over the world will come give you invited talks.
- Assignments are due on the day of, *before* class.

# About me.

- Originally studied philosophy, got into applied cryptography as a passion.
- First project: [Cryptocat](#) (while in undergrad.)
- Moved to Paris in 2015 to pursue Ph.D. in computer security and applied cryptography. I specialize in designing and formally verifying cryptographic protocols.
- Peer-reviewed publications, etc.
- Personal website: <https://nadim.computer>

# Goals of this course.

- Understand the basic principles of:
  - Computer security.
  - Cryptographic constructions underlying modern computer security.
- Learn practical skills:
  - Design secure systems.
  - Write secure code.
  - Exploit insecure code.
- Acquire important knowledge in:
  - Applied cryptography.
  - Designing and breaking secure systems.
  - Operating system security.
  - Network security.
  - Web security.
  - Security economics.

# Course layout.

- Parts:
  - 1. Cryptography
  - 2. Network Security
  - 3. Software Security
  - 4. Web Security
  - 5. Security and Society
- Graded items:
  - Class participation (10%)
  - Three problem sets (20%)
  - Two practical assignments (20%)
  - Midterm exam (25%)
  - Final exam (25%)
- **Keep the course website bookmarked:**  
<https://computersecurity.paris>

# Course guidelines.

- Bring a laptop to every class but only open it when asked.
- No smartphones during class.
- No eating in class.
- Academic integrity: there's no need to cheat. My job is to help you learn and succeed.
- Absences must be justified with a doctor's note or similar.
- *“Leaving class to go to the bathroom or yawning in class is considered rude in France.”* No problem in my class: please yawn and go to the bathroom all the time.
- Check your syllabus for the whole list of guidelines.

# Typifying Attacks

0b

*“Cybersecurity, computer security or IT security is the protection of computer systems from theft of or damage to their hardware, software or electronic data, as well as from disruption or misdirection of the services they provide.”*  
– Wikipedia.

*“Security engineering is about building systems to remain dependable in the face of malice, error, or mischance. As a discipline, it focuses on the tools, processes and methods needed to design, implement and test complete systems, and to adapt existing systems as their environment evolves.”*

– Ross Anderson.

*“Applied cryptography is the science and practice of designing and implementing real-world systems that derive their practical security guarantees primarily from mathematically ‘hard’ foundations, and only miscellaneously from access control.”*

– Me? I hope this is accurate.

# Today's reality.

There's a lot of buggy software out there...

## Top 50 Products By Total Number Of "Distinct" Vulnerabilities in 2017

Go to year: [1999](#) [2000](#) [2001](#) [2002](#) [2003](#) [2004](#) [2005](#) [2006](#) [2007](#) [2008](#) [2009](#) [2010](#) [2011](#) [2012](#) [2013](#) [Time Leaders](#)

# Can you think of any types of attacks?

## On these platforms?

## Or on these?

# Example: WannaCry Ransomware

**Oops, your files have been encrypted!** English

**What Happened to My Computer?**  
Your important files are encrypted. Many of your documents, photos, videos, databases and other files are no longer accessible because they have been encrypted. Maybe you are busy looking for a way to recover your files, but do not waste your time. Nobody can recover your files without our decryption service.

**Can I Recover My Files?**  
Sure. We guarantee that you can recover all your files safely and easily. But you have not so enough time. You can decrypt some of your files for free. Try now by clicking <Decrypt>. But if you want to decrypt all your files, you need to pay. You only have 3 days to submit the payment. After that the price will be doubled. Also, if you don't pay in 7 days, you won't be able to recover your files forever. We will have free events for users who are so poor that they couldn't pay in 6 months.

**How Do I Pay?**  
Payment is accepted in Bitcoin only. For more information, click <About bitcoin>. Please check the current price of Bitcoin and buy some bitcoins. For more information, click <How to buy bitcoins>. And send the correct amount to the address specified in this window. After your payment, click <Check Payment>. Best time to check is 11:00am GMT from Monday to Friday.

**Payment will be raised on**  
5/15/2017 16:50:06  
Time Left  
02:23:34:22

**Your files will be lost on**  
5/19/2017 16:50:06  
Time Left  
06:23:34:22

**Send \$300 worth of bitcoin to this address:**  
115p7UMMngo1pMvkpHjcrdfJNXj6LrLn Copy

# Threat Modeling

The bird's eye view.

The logo consists of a large white 'O' with a white dot in the center, followed by a white 'C'. The background is a solid purple rectangle.

# Kerckhoff's principle.

## Originated in cryptography...

- The security of a cipher should rely only on the secrecy of the key and not on the secrecy of the cipher.
- This came about in 1883, back when military encryption machines could be stolen by the enemy, leading to decryption.

## ...but can be generalized to security systems.

- Assume the attacker knows the system.
- However, the attacker doesn't have:
  - Access control.
  - Authentication.
  - Ability to modify the system, etc.

# Threat model for a bank.

## Threats to consider for a bank.

- *Inside threat*: Main threat to bank  
bookkeeping is petty theft by bankers (1% get fired each year for this.)
- *Outside threat*: ATM machines. How to handle authentication? Prevent tampering?  
Secure communications?

# Threat model for a bank.

## Some more threats to consider.

- *Online banking*: Users could be susceptible to trickery (phishing) or could have their account hijacked by exploiting bugs in the bank's web applications or in their browser (XSS.)
- *High-value messaging systems*: Internal communications, regularizing balances between branches, etc.

# Threat model for a bank.

## Let's talk about “security theater.”

- What is the value of having giant stone walls or solid marble tables?
- Whole books have been written about “security theater” (Bruce Schneier most notably).

# Did you know?

ATMs were the first large-scale commercial deployment of cryptography and helped establish a number of standards.

# Threat model for a military base.

## Threats to consider for a military base.

- Prevent enemies from jamming your radars while jamming theirs.
- Denial of service prevention takes a higher priority.

# Test your knowledge!

What is the better way to protect nuclear weapons from unauthorized access?

- A:** Store them in a secret location.
- B:** Require multiple authentication methods spread across multiple people.
- C:** Dismantle the weapons, thereby removing the need to protect them.

# Test your knowledge!

What is the better way to protect nuclear weapons from unauthorized access?

- A:** Store them in a secret location.
- B:** Require multiple authentication methods spread across multiple people.
- C:** Dismantle the weapons, thereby removing the need to protect them.

# Threat model for a military base.

## Why not A?

- Kerckhoff's principle.
- Single point of compromise.

## Why not C?

- The security engineer rarely decides the requirements.

# Threat model for a home.

**Let's try to come up with one.**

- What are the risks?
- Who are the adversaries?
- What are the systems?
- What are the points of failure?
- What are the failure scenarios and their impact?

**Now that you have your threat model, you can reason about the systems you must design and implement.**

# Defining Security Systems

An overview to get you started.

Od

# “Systems?”

**Now that you have your threat model, you can reason about the systems you must design and implement.**

- But what are systems?
- Cryptographic protocols: TLS.
- Operating system: Linux.
- Application: WhatsApp.
- Embedded hardware: iPod.

# “Alice and Bob?”

## In *protocols*, we reason about:

- Principals: Alice, Bob.
- Security goals: confidentiality, authenticity, forward secrecy...
- Use cases and constraints.
- Attacker model.
- Threat model.

# “Application Security.”

**In *applications* and many *user-facing systems*, we reason about:**

- User compromise: device compromise, impersonation, phishing...
- Server compromise: leaks, database hacks...
- Usability and security.

Primitive

Operating  
System

Link each icon to the correct label.

# Each layer is exposed to different attacks.

- Systems layer:
  - Access control violations.
  - Privilege escalation.
  - Memory corruption.
- Primitives layer:
  - Side channels.
  - Cryptographic breaks.
  - Implementation errors.
- Protocol layer:
  - Implementation errors.
  - Design errors.
  - Outdated specifications.
  - Active attacks.
- Application layer:
  - User error or manipulation.
  - Bugs in the code.

# End of introductory session.

**I hope you now have a clear picture of what our class is about:**

- Introducing fundamental computer security concepts.
- Introduce security engineering and analyze it from an attacker's perspective.
- Design and break real-world systems.
- Understanding security's role in society and ethics' role in security.

# Next time: Cryptography

The building blocks of modern  
security systems.

1
